

Exercise#7: Portfolio Website Project Using Vue.js and Tailwind CSS

INT250 CSS Framework (Semester 2/2025)

Deadline: Wednesday, 20 May 2026, 11:59 PM

Deliverables: ZIPPED/Vercel/GitHub Link on CSCMS

A. Project Overview

In this assignment, students are required to design and develop a Personal Portfolio Website using *Vue.js* and *Tailwind CSS*. The website should present the student's personal profile, skills, projects, experiences, and contact information in a clear, visually appealing, responsive, and user-friendly manner.

This project is intended to integrate the knowledge and skills learned throughout the course, from basic frontend structure and styling to responsive design, component-based development, accessibility, interactivity, dark mode, and performance optimization.

B. Project Objectives

By completing this project, students should be able to:

1. Apply Vue.js fundamentals to build a structured and component-based web application.
2. Use Tailwind CSS utilities effectively to create a modern, consistent, and responsive user interface.
3. Demonstrate understanding of the full course content by integrating design, layout, responsiveness, accessibility, interactivity, and optimization into one complete website.

C. Project Theme

Create a Personal Portfolio Website that presents you as a potential candidate for an internship, cooperative education position, or future employment opportunity in the IT industry.

For this project, assume that the audience of your website is not only a general visitor, but also a CTO, technical lead, recruiter, or HR representative from a company who is reviewing your profile. Your portfolio should therefore be designed to communicate your strengths clearly, professionally, and strategically.

Your website should help the viewer understand: who you are, what technical and professional skills you have, what projects or experiences you have completed, what role or career path you are interested in and why you would be a valuable candidate for an organization

Students should think carefully about how to present themselves in a way that is both: professionally credible for HR or recruiters, and technically meaningful for CTOs or technical interviewers.

This means the portfolio should not only look attractive, but should also demonstrate technical competence, clear communication, good structure and organization, attention to user experience, and readiness for a real-world professional context.

Your portfolio should be suitable for presenting to internship supervisors, company recruiters, HR representatives, technical managers, and CTOs or startup founders.

D. Technical Requirements

Required Technologies: Vue.js and Tailwind CSS

Development Requirements:

- The project must be developed as a **single-page application (SPA)** or a **multi-section one-page portfolio or multi-page** using Vue.js.
- Students must use Vue components appropriately.
- Students must use Tailwind CSS utility classes for styling and layout.
- The design must be responsive and work well on mobile, tablet, and desktop.

E. Required Website Sections

Your Personal Portfolio Website must include at least the following sections:

1. Hero Section includes your name, your role or title (e.g., IT Student, Frontend Developer, UX Enthusiast), short introduction, profile image, call-to-action button(s), such as: View Projects Contact Me, etc.
2. About Me includes a short biography, educational background, personal interests, career goals or future aspirations.
3. Skills Section includes skills related to your field, such as programming languages, web development, design tools, frameworks, soft skills, etc.
4. Projects Section includes project title, short description, technologies used, your role or contribution, image, mockup, or screenshot, link or button (if available).
5. Experience/Activities Section includes relevant experience such as coursework, internships, competitions, hackathons, volunteer work, academic activities, certifications, etc.
6. Contact Section includes email, social links (e.g., GitHub, LinkedIn, Facebook if appropriate), contact form or call-to-action.
7. Footer includes copyright text, student name, optional quick links or social icons, etc.

F. Course Knowledge Integration

Your project must clearly demonstrate the knowledge learned throughout the semester.

G. Design Expectations

Your website should demonstrate good design principles. Students are expected to pay attention to visual consistency, spacing and alignment, typography hierarchy, color harmony, readability, user-friendly navigation, balanced content layout, and clean and modern presentation.

Avoid: overcrowded layouts, inconsistent spacing, too many colors, unreadable text, poor contrast, broken responsiveness, and copy-paste template without customization.

H. Deployment Requirements

Students are required to deploy their Personal Portfolio Website to Vercel so that the project can be accessed online through a public URL.

Each student must:

- deploy the completed project to Vercel
- ensure that the deployed website is publicly accessible
- verify that all pages, sections, images, and interactive features work correctly in the deployed version
- submit the live project URL
- make sure the deployed website matches the submitted source code.

I. Submission Requirements

1. Source Code Folder (excluding “node_modules” folder)
2. GitHub Link
3. Live Deployment URL (Vercel)
 - a. public Vercel link of the portfolio website
 - b. the deployed version must be functional and accessible
